

SAFETY, ERGONOMICS AND HEALTH PROTECTION

The RX offers ergonomic and tactical advantages, which provides less physical strain on the emergency crews and greater operational success. The driveshaft-free vehicle concept allows equipment compartments to be extended downward, reducing physical strain on emergency crews. In operation mode, the body can also be lowered to an entry height of just 10 inches. The RX's many assistance systems help the crew stay safe and ensure accidents in difficult situations. This includes electronic rearview mirrors with an increased field of vision, full rearview due to an integrated rear camera, automatic object recognition to avoid collisions, and a night vision function. Cab communication for the emergency crew is improved through rotatable commander seats and an oval seating arrangement. In addition, powerful LED strips ensure shadowless illumination of the operating environment and, in many scenarios, eliminate the need for a light tower on the apparatus.
